# Abstract

Liontrader is essentially a hybrid forex/crypto CFD broker that records all the traders positions on the blockchain in real time as well as creating a safe networking environment for traders in the Metaverse world with the aim to increase transparency and reliability for traders.

It is an easy conclusion to make that established brokers and trading systems can manipulate a centralised system due to their sheer size and market power. LionTrader, while a centralised broker, can be openly monitored by the public. The exposure of every single trade on the blockchain, converts the traditional centralised concept of a broker into a decentralised one. This revolutionary enforcement of transparency via decentralised system, hand in hand with the trading leverage and bonus offerings allows traditional traders to enter the world of Metaverse where social trading, copy trading and analytics run openly with no limitations.

## Liontrader

### Introduction

Without any doubt, the digital world has transformed drastically since the appearance of the internet and has come a very long way since it's early appearance. In turn, blockchain technology has appeared to be the next big transformer of the digital world with its cryptocurrencies being the biggest economical hype of our generation due to the liberation of the financial system. In the past, perhaps the only dream was to be able to use blockchain technology, but now it has become pervasive enough to shift the public mindset from just an efficient peer to peer system to a competitive service-providing one with the hopes of making human life better. It is believed that it shall take over the world with incredible speed due to its efficient applications.

This is why in 2021 the Liontrader project stepped up to utilise this technology by decentralising the traditional centralised broker system and further moving the traders into the exciting new future. It's way of earning trader's trust is through full transparency.

## Problem statement

Currently, the centralised Forex or Crypto broker has its traders approving the indicated price of a CFD pair by opening and closing a position on the relevant platform. It's a given that any price shown by the broker on the platform is a synthetic calculation of the actual market price in favour of the broker and can be manipulated by the broker even after the position is closed. So questions such as the following will always remain unanswered: What is the real retail price? How far can a broker manipulate the price? Was the specific price really traded when our trade closed at loss?

Lack of validated data that the trader can refer to in order to seek answers to the questions above is the issue. Otherwise, all traders would reach a consensus and make sure that this data is consistent with their trading, and indeed such a price has been traded and everyone's account has been a party to the transaction.

Other problems lie within the analytical and social aspect of trading. Validation of trading analytics without the influence of social hype is quite difficult. Usually analysts are validated by their social followers, their likes, comments and shares and may not always be backtracked. Accuracy of analysis could be improved if they were to be exposed in a transparent way to begin with and are followed through by social groups in the very same transparent environment. Moreover, the ability to maintain a socially safe and sound environment for trading analytics requires a very deep and complex database. This is because successful trades have proven to be reliant on too many factors such as news, market movements, liquidity, human speculations and so on i.e a hyper dimensional problem. In today's two-dimensional data systems traders are not able to use full mental power to apply multidimensional analysis. Metaverse addresses the limitations of the two dimensional world by providing a 3D environment for complex matters and their underlying multi factors. By aligning the environmental conditions with the work of analysis less analysts will be missing out on important factors.

## **Liontrader Solution**

Liontrader shall be solving the problems stated above by fully adopting:

- 1- Blockchain technology on trades
- 2- Blockchain and Metaverse on Social trading

## **Blockchain adaptation**

### **Liontrader on trades**

#### **Positions**

Liontrader is a hybrid forex and crypto CFD broker with a decentralized twist. All real trades (leading to the opening or closing of a position) are recorded systematically on the blockchain. This excludes pending positions of course. Liontrader confidently takes on the responsibility of it's full transparency and adheres to a healthy code of practice.

#### **Lino Tokens**

Lino Token is a unit of currency designed for use in Liontrader registered on the Binance smartchain. It launched initially with the aim of providing unique services for individuals using Lino as a means of payment, much like other stablecoins on the market. It quickly became a powerful token after receiving it's first audit certifications and shall continue to operate as both stand alone and Liontrader's native token.

### **Deposits and Withdrawals**

Deposits and withdrawals of clients to and from Liontrader broker will be done via the project's native token Lino. Since all Lino transactions are originally placed on the blockchain anyway, no further bridging will be required and Liontrader platform will simply be a platform illustrating the total balance of the client's account at any given time.

## Bonus offerings

Payments of special trading bonuses to Liontrader clients shall be registered on the blockchain. For example, a trader is entitled to a trading bonus upon successful deposit of lino tokens into his or her trading account. Each month, 10% of the total amount of granted bonuses will be burned in order to maintain the value of the Lino token. Please also refer to the token burn section for more details.

## Staking

Lino token holders are entitled to receive potential profits out of staking on the blockchain via the Liontrader platform. This allows traders to potentially earn more even when they are not trading on the forex or crypto markets with their initial deposits and are holding their Lino tokens on the trading platform.

## Liontrader on social ecosystem

Liontrader's adaptation of blockchain creates an extensive database of traders and their trades that can be used for networking as a result of elevated transparency. This of course goes hand in hand with Metaverse which shall be explained further in the next sections however here we dig into the main aspects of the Liontrader's social trading.

## Social Network

The Liontrader project has planned and designed a communication network between analysts and traders through a specialised social network. In this space, however, the followers or the number of likes is not a sign of a person's popularity. Yet, that person's trading or analysis performance ranks him higher resulting in more popularity. Remember that this is only possible due to the availability of the trade information recorded on the blockchain. All traders or analysts who work in the Liontrader social network will receive the Liontrader native token Lino which they can use to purchase NFTs, open larger positions and receive further advanced utilities depending on the type of activity and the specific amount of content production.

## Trading competitions

Unique identifiers will be designed for traders that choose to take part in trading competitions and be ranked on a submitted list to the blockchain. Of course, for the sake of privacy, this list does not include account balance or the amount of their profit or loss. Also, the broker also complies to the regulation rules therefore client's identifications will always be kept away from the public eye and are solely used for client validation purposes. Only the number of successful trades with the percentage of profits made will be exposed. Once again note that due to the fact that all trader positions are registered on the blockchain and cannot be edited, the ranked list shall be highly reliable.

## Trading education

Liontrader aims to offer a novel education system to empower trader's abilities and extend their knowledge. It will also create an ecosystem in which professional traders can share their knowledge with others in case they have had at least a 10% capital increase in a certain period of time. Once again note that this is only possible due to the availability of the trade information recorded on the blockchain. Traders will be awarded a Lino token for each training they share on their trading method. In this section, the Liontrader project envisages a comprehensive program for the Metaverse space, in which traders and analysts hold their seminars or live streams in the Metaverse space. Each person in this space chooses an avatar for itself using NFT technology, and with that avatar, one is known in the social area of Liontrader. The social network section provides group analysis and trade to let the traders perform with an open and more robust vision towards growth and training.

## Analytics

Liontrader provides analysts with demo accounts that record trades on the blockchain. Since, the success or failure of the analytical predictions registered on the demo account are shared with the public via blockchain, ratings and reviews of analysts would be done more transparently than ever and using full scope of the data. Using this information Liontrader makes a list of top analysts that have consistently matched their predictions for the public, creating healthy and transparent interaction between like-minded traders and analysts.

Liontrader encourages true analysts through concessions. For example successful analysts with turn over rates above and beyond 55% are rewarded with Liontrader's native token Lino. This reward cycle continues as long as the analyst is successful, motivating him to work harder and engage better every time. In return, wrongful analysts are left demotivated and pushed out of the system making the environment safer for the traders to follow true analysts. This is how the possibility of fraud or wrongful marketing is reduced to the minimum, while in the past we have seen those inefficient analysts, due to dominating social networks but without sufficient knowledge, cause harm and deception to traders. In contrast, analysts who are highly talented but unable to build powerful social media or wish to remain anonymous were marginalised. Bear in mind that not only all successful analysts are supported, but are kept anonymous through Liontrader.

## Metaverse adaptation:

One of the most attractive features of the Metaverse space is the ability of being in different desirable places and situations depending on the needs of each person. This cyberspace can host a game or a virtual utility in a 3D world when users wear virtual reality goggles. Liontrader's Metaverse has the goal to create an atmosphere where traders can use their maximum mental power and filter all the distractions from the surroundings during analysis, training and trading as well as being present in a world that belongs to the future whilst trading.

## Virtual Trader Room

Liontrader project is designing a trading room in Metaverse in which a trader will be manoeuvring across actual financial charts by wearing virtual reality glasses. Traders can scan through the ups and downs of the charts by literally hovering over the charts. Then the trader can choose a chart depending on the needs and expertise and start trading. This method of trading will be much more efficient in the future, for several reasons. First, you will focus on the meta-space inside your virtual trading room without outside distractions. Second, in the trading meta-space, you can have unlimited categories of charts shown in 3D that would be easier to understand than 2D charts depending on your type of trading and analysis so you can review and finally trade with maximum mental power and focus.

## Social network in Metaverse

As explained thoroughly in the Liontrader social system section, there is a need to build a healthy transparent eco system for traders. Liontrader analysis and training will be carried on a Metaverse platform that holds the ecosystem together.

## Interactive platform on social network

In this social network, people are identified with the digital verification of their NFTs. This is because the Liontrader project is based on registering and approving blockchains so people need to have a digital identity with work history to be popular. In the Metaverse social network, interaction also plays a key role. Analysts allowed to analyse in the Metaverse space are paid a Liontrader project token (Lino) for a certain amount of content production.

## Practice rooms in social network

Traders are divided into medium and professional groups. Entering this section requires an initial test so that every trader must answer a few technical questions or have a trading history. This filter prevents people who do not have the minimum trading skills from entering this room. In practical social networking rooms, traders can interact and even trade. The practical social network will have rules that increase or decrease each period using periodic voting. People who have a minimum presence in this network can participate in voting.

## Virtual seminar and workshop rooms:

Current online webinar platforms try incredibly hard to increase the interactivity between their audience and presenter. A lot of this effort ends in no results due to the impeccable number of available distractions that can exist between trainees and the display monitors. Taking this concept to the 3D world of Metaverse where more focus is guaranteed due to the virtual reality goggles, and adding fun and interactive training sessions using avatars and inspiring visual effects is the aim of the virtual training rooms of Liontrader in the Metaverse space. To reward the interactivity Liontrader will have a point based system for the members of the training room raising their motivation to be ahead of the game. These points can be converted to Lino tokens for trading on the Liontrader platform.

# Lino Token

## Introduction

Lino Token is native to the Liontrader brokerage, based on the high speed Binance Smart Chain. Lino token will be used as a utility token in the Liontrader project. One hundred twenty-three billion of these tokens have been made, and the uses and types of performance are listed in the white paper. Also, all Lino tokens are separated, stored and locked in specific wallets with specific addresses for more clarity. This categorization method helps the holders access and know why each has been opened or entered into the cycle. The way of locking the tokens and the supply will be entirely in line with the flow of the project and will be made public. You can see all the transactions of each specific wallet on the BSC Scan Token page in the Holders section.

## Wallet distributions

### Stake

The stake wallet contains 20% of Lino tokens used in Liontrader trading accounts. The method of operation is that in the member's area of the Liontrader platform, a section is created for staking in which the trader can place the Lino tokens when they are free from trades. When a trader has tokens that are disengaged with any open position in the system, he can connect his wallet and receive daily rewards for staking. This is if at least 24 hours have passed since being placed in the liquidity pool to receive a profit. The reward process will vary depending on the number of stake tokens reduced. It means that for every 1% of tokens paid as a bonus to the total of the main stake wallet, the amount of the bonus decreases. This protects tokens from inflation. Each 60 days, 5% of the stake tokens are given to the stakers as a reward, while another 5% of the tokens are unlocked.

### Wallet address:

0x42746851ea735EAf9bEcB1AFA6dcd07fed4Afe01

## Burn

Burn's wallet contains 20% of Lino tokens, which will be used to prevent inflation. When the project is fully launched, and a trading account is created, 5% of the tokens are burned in different stages. The method of burning tokens will change when the trading project is fully launched. The Liontrader project will pay bonus account tokens to trade account holders at various times which can be used for trading, and at the end of 30-days, the amount of available bonuses enters the cycle and is determined. 10% of the total bonuses paid from the Burn wallet will be burned. Due to this method, the lock of Burn wallet tokens is extended every 60 days before the full launch of the project. And this process continues until 5% of the tokens in this wallet are burned. Once the project is fully implemented, this lock will be extended for 30 days to the amount available in the wallet.

### Wallet address:

0xF01e4f095283A7926908EbbA3f03f3f308b0f1Af

## Liquidity

Liquidity wallet contains 20% of Lino tokens, which are used to provide liquidity in exchange offices and Liontrader brokers. Liquidity wallet tokens are divided into two parts: The first part, which includes 75% of this pool, will provide liquidity in reputable decentralised and centralised exchanges. The other 25% will be in Liontrader Broker, and the liquidity inflow to the exchange offices will be according to the project roadmap and will be made public. Listing in any centralised or decentralised exchange is directly related to this wallet. The lock of this wallet is determined depending on the time of listing in the new exchange and any amount needed to add liquidity to a specific exchange is unlocked. This amount will also be specified in the transactions of this wallet.

### Wallet address:

0x83EcB4023EeEf7c335127E06f0183b4667b2A633

## Development

The development wallet contains 10% of Lino tokens used to develop the project. The business development department owns tokens from this wallet for helping the project software, content production and social network grow. All rewards paid from this wallet will be made available to the public in a separate list. This amount will be extended for 60 days according to the required amount before the start of the project however after the full launch of the Liontrader project, this time changes to 30 days. You can see all the transactions of each specific wallet on the BSC Scan Token page in the Holders section.

### Wallet address:

0xf64D25717A0D9E7995a5527a59beEfc6779cb4a7

## Listing

The listing wallet includes 10% of Lino tokens, used to list tokens in reputable exchanges. The time of listing the token in each exchange and the time and reason for selecting the desired exchange will be made public. The time and amount of opening the token in this wallet will also have a 60-day program. This means that when it is to be listed in an exchange, this date will coincide with the opening date of the token value.

### Wallet address:

0xbee8408448dF04438b6C9DE118f95D8758AeA11b

## Team member

The Team member's wallet includes 10% of Lino tokens, which will reward people involved in the project. The tokens will be locked due to the size of the people who will be collaborating on the project. The tokens of this wallet will be locked according to the cooperation contracts in 90-day periods and paid for technical or development activities.

### Wallet address:

0x283558aeE06914CA2991b5c6DAe8bdD5B20Ba88b

The project wallet owners are transferred and separated from the Team member wallet, containing 0.8307% of Lino tokens. The security code of this wallet has been cleared and has made it inaccessible to ensure the decentralisation of tokens. It will be symbolically placed between wallets and will have no activity forever.

### Wallet address:

0x18c273d91bebb59426e31fa63f1e2f967f69dd4a

## AirDrop

The AirDrop wallet contains 5% of Lino tokens, which are used to expand the Liontrader community and introduce the public. Lino tokens will use the AirDrop method for expansion and initial release; at each stage, a certain number of Lino tokens in AirDrop will be paid as a reward. The lock of AirDrop tokens will be unlocked according to the AirDrop time and amount in the period of 60 and 90 days.

### Wallet address:

0xC429F21711f88a8D83B77B79c0AbFAaC46baEd47

## Charity

The charity wallet includes 5% of total Lino tokens, used by community voting for charity.

The locked tokens will be unlocked for charity due to community voting time.

### Wallet address:

0x6512c6753895461057c08600234c05652145111F

## Final Notes

This white paper will be updated as the goals and needs of the community are achieved. The development team of this project believes that new sections can be added to the project. We think this path should be followed step by step, and after the initial launch of this project, the job continues along with voting from the community in other new sections. This white paper will be updated and completed in the future.

# Road Map:

## October 2021

LINO Website, Whitepaper and  
Social Media Launch.  
Private Sale Phase,

## November 2021
